Your Vision, Our Future

Stereo Microscope System

**SZX7**

For Life Science Use

Comfort and High Quality for Life Science Imaging

## Easy on the Eyes: User Comfort is Where Precision Performance Begins

The SZX7 stereo microscope from Olympus is easy to use and delivers outstanding optical performance so that users are comfortable performing imaging tasks from advanced research to routine inspections.

The microscope's Galilean optical system, previously restricted to more specialized microscopes, offers the best zoom ratio in this class, as well as outstanding image clarity, true color, and accurate reproduction of the original specimen in crisp, well-defined detail.

The SZX7 can be customized using a range of accessories to accommodate a variety of specimen types and sizes.

# Quality Optics for Consistently Superior Image Reproduction

Clear, accurate specimen observation without strain. With its smooth finish, apochromatic zoom optics, ComfortView eyepieces, and easy adjustability, the SZX7 minimizes strain and fatigue while fulfilling the key mission of Olympus microscope designers—to provide the optimal image for any specimen. The performance of the high-level Galilean optical system is complemented by much less distortion than before with high numerical aperture.

The SZX7 microscope body is manufactured using newly developed lead-free optics, demonstrating Olympus' commitment to protect the environment.

## 7:1 Wide Zoom Ratio

With a magnification range of 8X–56X (using a 1X objective/10X eyepieces), the SZX7 offers a zoom ratio of 7:1. This is the best in its class and enables a specimen to be observed at the most appropriate magnification.

## Excellent Resolving Power

High-quality objectives deliver accurate, high-resolution images that show specimens in minute detail.

## A Range of Objectives to Suit Every Specimen and Every Application

- **Superior Image quality with high resolution and excellent flatness:**

The new DFPLAPO1X-4 objective provides excellent optical performance, with plan apochromat correction and an NA of 0.10.

- **Longest working distance (W.D.) in this class:**

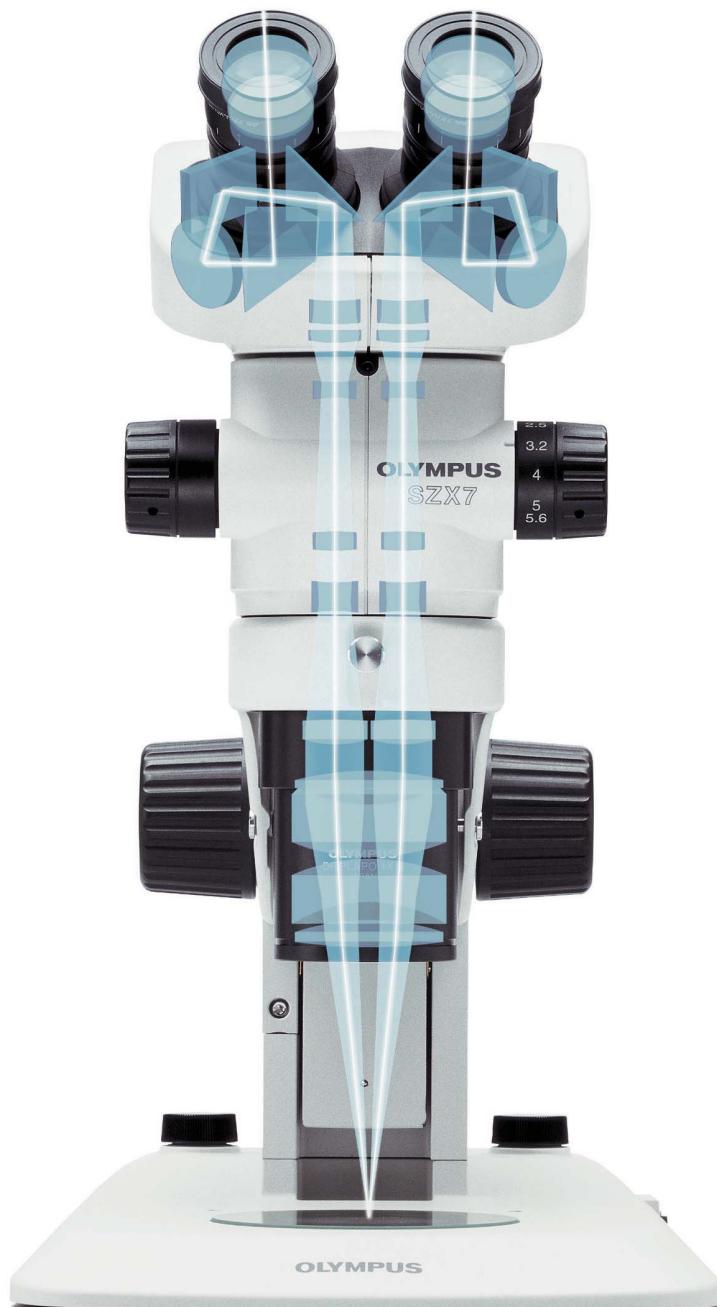

Objectives range from the SZX-ACH1X (90 mm W.D.) to the DFPL0.5X-4 (171 mm W.D.). As a result, difficult to access surfaces can be easily observed.

## Accurate Color Reproduction

Careful selection of lens surface coatings and apochromatic zoom optics make it possible to observe and document specimens with accurate color reproducibility.

Observation tubes

Galilean optics feature two (right/left) independent and parallel zoom optical paths. This system enables high optical performance as well as system modularity.

### "ComfortView" Eyepieces for Greater Comfort and

#### Faster Work

New ComfortView eyepieces feature pupil aberration control and appropriate positioning in the eye point for fast and comfortable observations. The result is a field of view that is easy to find, comfortable to view, and easy to keep.

### Convenient Front-Access Operation

Improved access to the most frequently used knobs and controls maximizes operator comfort and reduces neck and back strain.

### Quickly Recall Magnification Settings via Click-Stop

#### Mechanism

Many inspection and documentation tasks require the use of a known zoom magnification setting to ensure consistent and comparable results. The integrated click-stop mechanism provides quick and easy access to this important function.

Tilting binocular head / SZX-TBI

# Fluorescence Unit with Coaxial Illumination Enables Clear, Bright Observation Even with Weakly Emitting Specimens

This reflected light fluorescence unit is used to observe fluorescence in living cells under a stereo microscope. The high-performance fluorescence filter sets have sharp cutoffs and high transmission to capture even faint emissions from fluorescent proteins.

## Reflected Light Fluorescence Unit SZX-RFL2

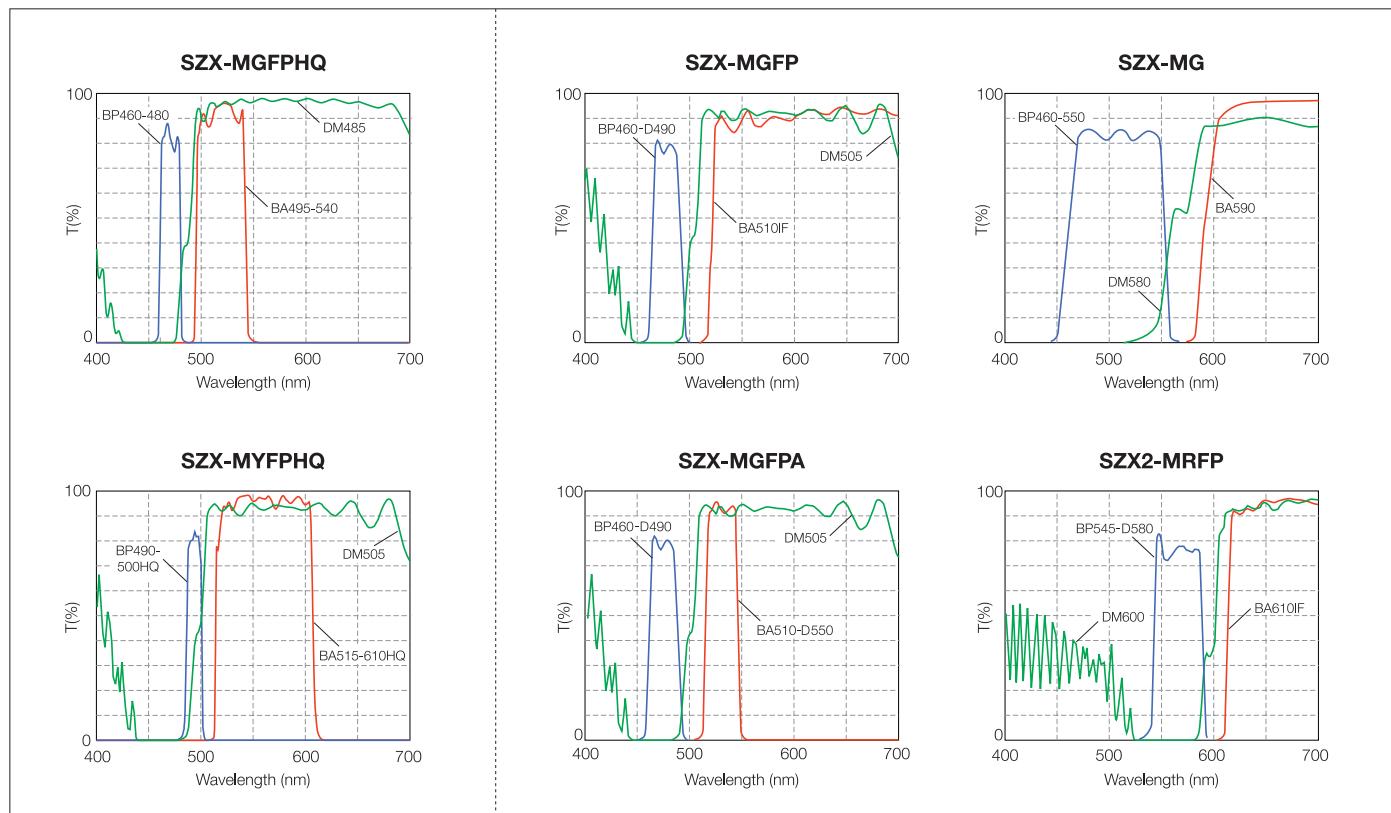

Three fluorescence filter blocks can be mounted in a 4-position slider. An open position is provided for easy access to transmitted light observation. The light source is a 100 W mercury lamp, for bright fluorescence observation with high contrast. A total of six filter sets are available, depending on the purpose.

## High-Performance Filters for GFP/YFP

Two different types of high-performance filter sets are available for GFP/YFP. Optimized for the characteristics of GFP/YFP wavelengths, they have high transmission rates of 90% to 95% and sharp cutoffs for efficient detection of even weak fluorescence.

# Choose the Illumination Source That Suits Your Sample

## LED Illuminator Stand / SZ2-ILST

The LED stand features a thin design to keep sample positions low and to optimize usability. Simultaneous transmitted and reflected light are available on this stand. LED light offers both long lifetime and constant color temperature at any intensity.

## Transmitted Illumination Attachment / SZ2-ILA

Used with the SZ2-ST this cost-effective illumination stand provides bright, uniform illumination from low to high magnifications. An adjustable mirror provides direct and oblique illumination for low contrast specimens. Available LED light source (SZ2-CLS) and a 100 W light source (LG-PS2) provide the necessary power for a variety of illumination needs.

## Brightfield/Darkfield Transmitted Light Illumination Base / SZX2-ILLD

Enables darkfield observation under illumination twice as bright as previous Olympus stereo microscope models. Flat and thin specimens, such as brain tissue slices, are vividly displayed on a black background.

## Slim LED Transmitted Light Illumination Base / SZX2-ILLT

With a slim 41 mm design, this transmitted light illumination base has a lower height to enable a low eyepoint and easy access to base-mounted samples during observation and operation.

A variety of fiber guide illumination systems are available.

Flexible light guide / SZ2-CLGSF

Dual interlock light guide / SZ2-CLGDI

Six-point ring light guide / SZ2-CLGR

Coaxial reflected light illuminator / SZX2-ILLC10

# Flexible for a Variety of Applications, from Digital Imaging to Observing Large Specimens

## Digital Camera / DP73

By combining Olympus digital camera technology with high-speed processing hardware, images with up to 17.28 megapixels can be captured at high speed while maintaining image quality, accuracy, and color fidelity. Images can be captured at resolutions up to 4800 × 3600 pixels.

## Light Beam Splitter / SXZ2-LBS

Two digital cameras can be attached simultaneously. The light path can be changed between three different settings: 100% observation, 100% digital camera, and 50% observation and 50% to both left and right cameras.

## Photo Adapter / SZX-PHA

Various adapters are available for different kinds of CCD cameras, and can be used with the beam splitter.

## Ergonomic Tilting Trinocular Tube/SZX2-LTTR

## Extendable Eyepoint Adjuster/SZX2-EEPA

Tilting trinocular tube and eyepoint adjuster enable comfortable microscope work even over long periods. Users can adjust the tilting tube angle from 5 to 45 degrees and move the height of the eyepoint within a 120 mm range to maximize comfort. Moreover, attaching a digital camera enables users to obtain high resolution images at 1920 × 1440 pixels, which exceeds standard high-definition resolution .

## Side by Side Discussion Tube / SXZ-SDO2

Ample distance (650 mm) is provided between the primary and secondary observers, making observations easy without disturbing microscope operation. The color of the built-in pointer can be selected to contrast the specimen.

## Various Universal Stands

A variety of universal stands are available for the observation of large size specimens. No matter the size of your sample, Olympus has the right choice of stands to suit any requirements.
